

# Automatic transmissions, torque converters

We offer professional remanufacturing of the following types of automatic transmissions used in passenger and delivery vehicles:

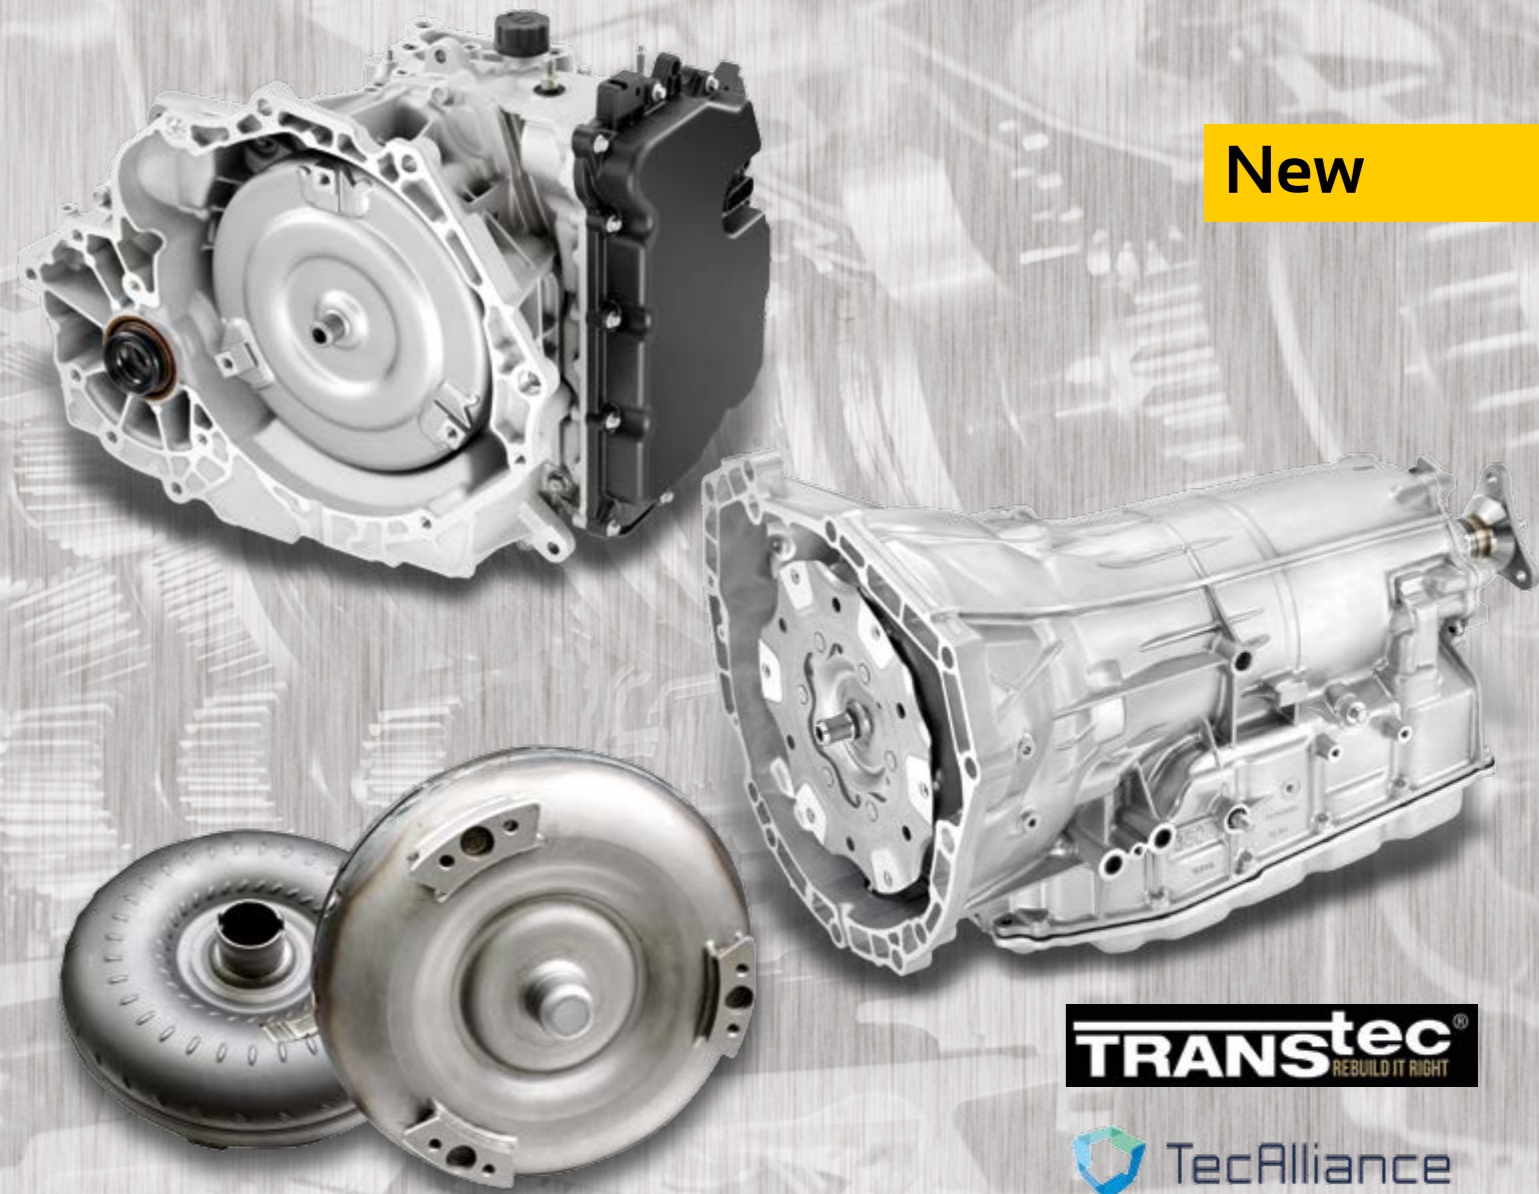

- Classic automatic transmissions with torque converter
- Continuously variable transmissions (CVTs)
- Dual clutch gearboxes (DCT / DSG)

During the remanufacturing process, all components are thoroughly checked for mechanical damage, electric / electronic. All defective components are replaced with new ones, and the rest is thoroughly cleaned. The complete gearbox is dynamically tested after the regeneration process on a specialized test bench. It is designed to drive transmissions of cars with front-wheel, rear-wheel and all-wheel drive. This device is unique because of the ability of mapping the working environment of the transmission installed in the vehicle in workshop conditions.

Therefore, it allows for a full functional test of the transmission before it is handed over to the customer and installed in the vehicle.

We do remanufacture automatic transmissions of the most popular manufacturers, such as:  
**ZF, Jatco, Getrag, Aisin, General Motors (Hydramatic), Mercedes, Renault, Allison.**
